Project Title: Student Skill Development Management System

Photographs:

The screenshot shows the SkillTrack Assessments page. It displays a table with the following columns: Assessment, Status, Score, and Date. The table contains three rows of data, each representing a different assessment.

Assessment	Status	Score	Date
Intermediate Assessment	Completed	85%	15 May 2024
Advanced Assessment	Completed	75%	15 May 2024
Expert Assessment	Completed	85%	15 May 2024

Project Description: (here you write what you did in this project including Model Description The Integrated The Student Skill Development Management System is a web-based application designed to help students identify, assess, develop, and monitor their technical and professional skills through a centralized platform. The system provides a structured environment where students can register, log in, manage their profiles, select relevant skills, participate in skill based assessments, view their scores, identify their skill levels, and access suitable learning resources. It consists of major modules including User Authentication and Account Management, which handles registration, login, authentication, validation, and role-based access; Student Profile and Skill Management, which manages student profiles, technical skills, professional skills, and skill-level information; and Skill Assessment, which provides questions, answer submission, automatic score calculation, percentage calculation, and classification into Beginner, Intermediate, or Advanced levels. The system also supports Learning Resources and Progress Tracking, allowing students to access skill-related resources and compare their current assessment performance with previous results. The application follows a layered web-based architecture with presentation, application, and database layers, where the interface manages user interaction, the application layer processes authentication, assessment, score calculation, resource retrieval, and progress operations, and the database stores student profiles, skills, questions, answers, results, and learning resources. Input validation and authentication mechanisms are used to maintain data accuracy and prevent unauthorized access. By bringing skill assessment, learning resources, and progress monitoring into a single platform, the system reduces manual effort, improves accessibility, helps students understand their strengths and areas for improvement, and supports continuous skill development. The system can also be extended in the future with advanced skill recommendations, personalized learning paths, mobile application support, analytics, and intelligent assessment features.
